

Explore

Plan

Implement

Verify

Summary:

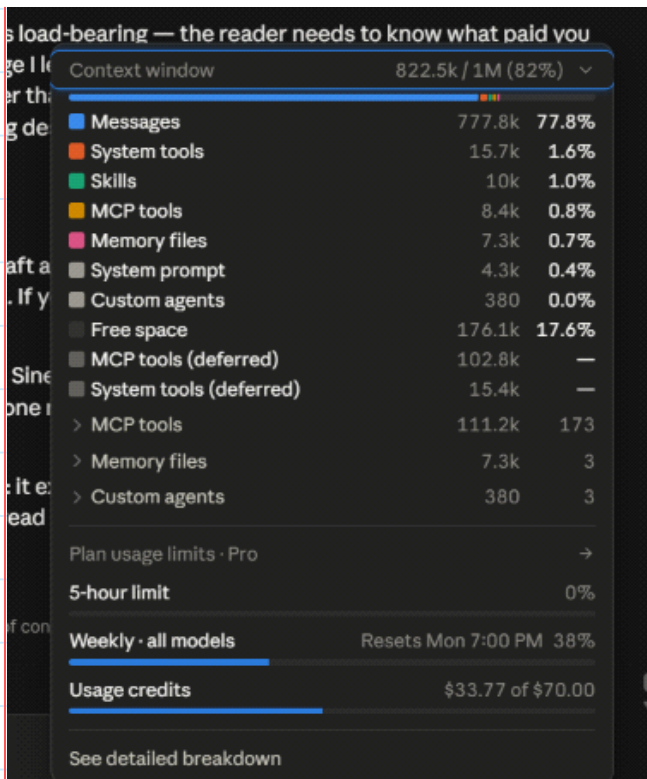

Key Take Aways

- Absence of structure is the biggest Problem. Following the Explore>Plan>Implement>Verify cycle helps to stay focused, structured, and achieve your goals faster and more consistently.
- Context is the scarce resource, and phases are context boundaries.
- Verification should be machine-runnable, which means it has to be designed during planning, not discovered afterwards.

Phases are context boundaries: Verify: Does that mean that start new chat with each phase?

Verification should be designed during planning:

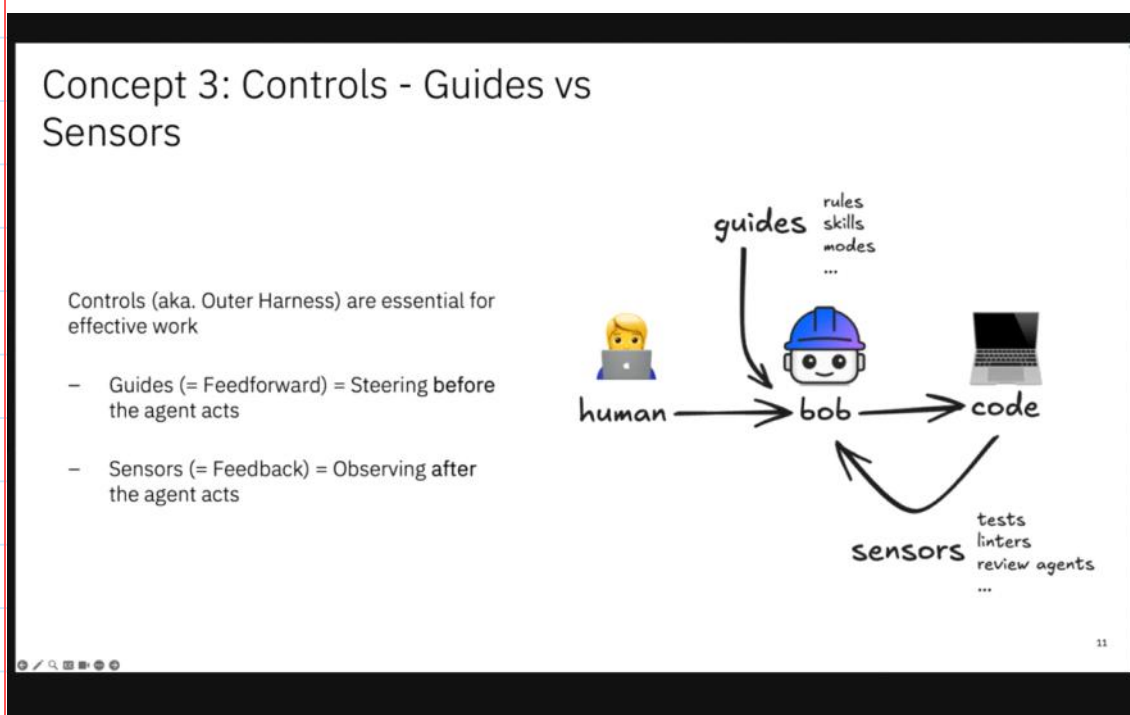

Per conversation try to complete the only half the circle.

Bob, might forget the mistakes you made, so write them separately.

Compaction : /compact is lossfull.

When to start a new chat?

Focus on Sensors too, not just guides.

(Eg:)

Skills are re-usable prompt templates.

They save tokens. But, for Bob's simplicity, describe the Skills accurately so Bob will call it at the right time.

/create-skill: for things you are doing multiple times.

Create a plan for Bob - done using Claude code.

Ask Bob to Grill your plan.- grill&

Modes:

Already built in modes are agent-mode and custom modes. But you can create your own Mode!

Bob will do tasks using that personality.

U can make a mode that does not have "Write" permissions. So u can edit that while having a peace of mind.

Hooks:

This is the deterministic part unlike Modes, Skills which are more like

suggestions.

Eg: When you start your conversation, it will run a bash script that checks:

- 1) If the branch is clean, Java versions, etc.
- 2)

This is a GITHUB action whose trigger is a git pull:

Before git Push:

- 1) It can check for API secrets. - this one I already had.
- 2)

U can also make good logging tools using hooks.

These things you should not ask Bob for it because It is good to make it deterministic

Implement and verify are separated by a blurry line.

Another Use case for Github actions:

It can review your pull requests that you have just created.

Implementation plan + Github issues + Bob's pull request review.
